In Case of Power Loss or Building Ventilation Failure: *FUME HOOD*

Fume hoods do not have an internal fan. They are 100% hard-ducted to the building ventilation system. If either the building ventilation system or the electrical power is out, the fume hoods will not work.

- Check the fume hood’s gauge or tell-tale for airflow and take the following precautions, if applicable:
  - Stop all operations.
  - Securely cap any open containers.
  - Close fume hood sashes.
  - Contact building facilities coordinator
